CORVEX

ENGINEERING & ENERGY SOLUTIONS

CAPABILITY STATEMENT

ENGINEERING, CONSTRUCTION AND OIL & GAS SERVICES — COMPANY OVERVIEW

Document reference: CX-CAP-001
Issued: February 2026 · Revision 01
Owner: HSE & Quality Directorate

CORVEX delivers technical services that keep critical operations running — safely, precisely, and to the specification that was agreed. Six service lines. Three sectors. One accountable contract.

01

WHO WE ARE

CORVEX is an engineering and energy services company working across the oil & gas, industrial and infrastructure sectors. Our teams are drawn from operating companies and EPC contractors, which is why we plan around the reality of a running asset rather than the assumption of a greenfield one.

We take on work that carries consequence: turnarounds on live plants, pipeline integrity on operating corridors, structural and civil packages that must stand for decades. Scope is frozen before mobilisation, assumptions are written down, and the handover dossier is assembled as the work proceeds rather than after it.

02

SERVICE LINES

LINE	CAPABILITY
Engineering Solutions	FEED and detailed design, brownfield modification, inspection planning, fitness-for-service assessment, peer review and project engineering.
Industrial Support	Planned and corrective maintenance, fabrication to ASME IX, machining, scaffolding, spares control and site logistics.
Critical Operations	Shutdowns and turnarounds, pre-commissioning and commissioning, operations support, risk-based integrity programmes.
Infrastructure & Construction	Earthworks, foundations, structural steel supply and erection, mechanical installation, roads, drainage and site services.
Oil & Gas Support	Upstream field support, pipeline construction and integrity, terminal and refinery mechanical services, metering and proving.
HSE & Compliance	Management systems, independent audits, competence-based training, incident investigation and certification readiness.

03

SECTORS SERVED

Oil & Gas

Upstream field support and gathering systems, midstream pipeline integrity, and terminal and refinery mechanical services executed on live plant.

Industrial

Shutdown support, planned maintenance and fabrication for plants that run around the clock, where windows are short and spares are pre-arranged.

Infrastructure

Civil and structural delivery for utilities and industrial development, with materials tested rather than assumed and as-builts maintained as we build.

04

DELIVERY METHOD

Our method is repeatable across every service line, which is what allows a lesson learned in one location to transfer without re-invention.

- **Assess** — survey the asset, capture actual condition, and freeze the scope before mobilisation.
- **Engineer** — design and plan against the applicable code, with independent verification before issue.
- **Execute** — deliver under permit with QA gates at defined milestones, not at completion.
- **Sustain** — hand over documented evidence and support the operating phase.

Standards applied — ISO 9001, ISO 14001 and ISO 45001 aligned management systems, with ASME B31.3, ASME IX, API 1104, API 570, API 653, API 579-1 / ASME FFS-1 and AWS D1.1 applied as the work requires.

05

QUALITY, SAFETY AND DOCUMENTATION

- Inspection and test plans are written per package and agreed before work starts, with hold points enforced.
- Welding is controlled at procedure level: every joint traceable to a qualified WPS, a certified welder and a recorded inspection result.
- Material certification and traceability are retained for every delivered component.
- Non-conformances are dispositioned with root cause analysis and verified closure.
- Handover dossiers — ITPs, NDT records, calibration certificates and as-builts — are assembled during the work.

06

ENGAGEMENT

Engagements begin with scope. Send drawings, a specification, or a one-line description of the constraint you are working against. A technical lead reviews the enquiry and responds within two business days with scope, constraints and a named point of contact.
